CAPICOM.DLL is a CAPICOM 2.1.0.2 DLL that adds functionality to other applications (including Microsoft Windows) by performing cryptographic operations such as encrypting and decrypting data, generating and verifying digital signatures, and hashing and encrypting data. The CAPICOM.DLL redistributable contains the DLL for the Windows operating system. CAPICOM is composed of 2 components: CAPICOM.dll (Crypto & NSP) and CAPICOM.Unicode.dll (Unicode support). Use CAPICOM.Unicode.dll to convert the CAPICOM.dll (Crypto & NSP) to Unicode. CAPICOM.dll (Crypto & NSP) is a DLL that contains functionality for performing cryptographic operations including encrypting and decrypting data, generating and verifying digital signatures, and hashing and encrypting data. The sample is a fixed at time of this release, that will be updated as soon as possible with new updates. This Redistributable comes as an installer file which extracts files and folders into specified directory of your choice. This file is in the 7zip format. **What's New in the Platform SDK Redistributable: CAPICOM?**

CAPICOM is a high level ActiveX component. Its functionality is used in various applications such as: Website pages (asp, PHP, VC++, etc.) Microsoft Word, Excel, Outlook, etc. AOL, Windows Media Player, even to maintain databases. CAPICOM Client Download Release: CAPICOM SDK Version: CAPICOM 2.1.0.2The present invention relates to a method of manufacturing a switching device and to a switching device manufactured by this method. Switching devices may be used in various applications. For example, a switching device may be used to carry high voltage loads that are connected to a control device such as a power station. The switching device may then switch the loads on and off in response to signals received from the control device. The switching device may be used to switch high voltage loads such as components in a gas turbine engine. In this example, the control device may be a component of the gas turbine engine. For example, a switching device may comprise a switch, a contactor, and an inductor. The switch is electrically connected to a power source, a switch coil, and a control unit. The contactor is connected to the switch and the inductor is connected to the contactor. The inductor is connected to the control unit. The inductor may comprise a magnetic core, which is connected to the control unit. The inductor may include at least one coil, which may be wound on the core, for example. The switching device may be used to switch a load between a state and an alternate state. In this example, the switch may be arranged to connect the power source to the load at the state and disconnect the power source from the load at the alternate state. The control unit may be programmed such that the switch is actuated to switch the load from the state to the alternate state in response to signals received from the control unit. Such an arrangement may provide for greater energy savings. Previously, the manufacture of a switching device would include the steps of moulding a pre-formed metal case and inserting the switch into the case. With previous manufacturing methods, the manufacture of a switch for a specific power source or application required the design of a different case for each possible application. This inevitably involved a large number of different cases being produced which needed to be stored until required. The manufacture of switches with a different case or with a limited range of cases was problematic because of the storage of
